this is your brain isolated from the world inside your skull your senses provide its only clues to what's going on out there but how can your brain take the limited information from your senses to build your trust worth reality why your brain is constantly being fooled by what you see what we're trying to is not the world as it is but something else we are actually generating perceptions of a world that's useful to see and that useful perception doesn't actually have to correspond with what's actually there when you open your eyes right first time in the morning say do you think you see the world as it really is it has to do with how your brain uses shadows to make decisions about what it's seeing take a look at any object one glance and you know what it is but how do you know what it is and where it is positioned in space the light reflected this object is converted by your eyes into an electrical signal and is sent down a neurological pathway called the optic nerve to the back of your brain starting in the region called the visual cortex the image is cross referenced with memory of past experiences started through your brain as you try to identify the object once it's figured out what it is your brain has to decide how the object is positioned in the space and one of its most reliable tools is use shadows in a world with a single light source your brain has learned to trust shadows as a near fool proof way to know the behavior of objects in space and in general it worked your brain using past experiences to generate its perception of the world
